

Cypress Interview Practice Checklist (1 Hour)

20 min – Run the Cypress Real World App

Goal: Become comfortable navigating the application. Start the frontend and backend. Log in with the seeded user. Create a new bank account. Verify the account appears. Watch the Network tab while creating the account.

20 min – Read bankaccounts.spec.ts

Read the test line by line and understand: How login works. How selectors are located (data-test). What assertions are made. Where `cy.intercept()` is used. How custom commands simplify the test.

10 min – Practice `cy.intercept()` and `cy.wait()`

Practice writing:

```
cy.intercept('GET', '/bankAccounts').as('accounts')
cy.visit('/')
cy.wait('@accounts')
  .its('response.statusCode')
  .should('eq', 200)
```

Also try mocking a response with a fixture.

10 min – Review `cypress/support/commands.ts`

Understand: `login()` `loginByApi()` Custom reusable commands Why custom commands reduce duplicated code

Quick Interview Tips

Prefer data-test selectors over CSS classes. Explain your thought process while coding. Use `cy.pause()` or `cy.debug()` to troubleshoot. If a test fails, inspect the Cypress Command Log and browser DevTools. Stay calm—correctness matters more than speed.
